Module 1.2

1 point

Recall the higher-order function `derivative` from class.

```
def derivative(f: Callable[[float], float]
               ) -> Callable[[float], float]:
     ...
```

What is the result of the following code?

```
y = 10
def f(x):
    return y * x * x + y

g = derivative(f)
g(20)
```
